Network security group security rules are evaluated by priority using the combination of source, source port, destination, destination port, and protocol to allow or deny the traffic. A security rule can't have the same priority and direction as an existing rule. You can't delete default security rules, but you can override them with rules that have a higher priority.

NIC network security group ⓘ

☒ None

☐ Basic

☐ Advanced

The selected subnet 'SUBNET1 (10.0.0.0/24)' is already associated to a network security group 'LINUXnsg'. We recommend managing connectivity to this virtual machine via the existing network security group instead of creating a new one here.

Delete public IP and NIC when VM is deleted ⓘ

New Support Ticket

Virtual network
VNET

The diagram illustrates a network topology within a Virtual Network (VNET). It features a central 'SUBNET1' box containing three virtual machines: 'LINUXMACHINE-01', 'LINUXMACHINE-02', and 'LINUXMACHINE-03'. These VMs are interconnected with a central 'LINUXMACHINE-04' node. To the right of the VNET, there is a 'SUBNET2' box and a 'LINUXMACHINE-05' node. The entire network is connected to an external 'LINUXMACHINE-06' node on the far right. The diagram is presented in a zoomable window with standard navigation controls.
